

Side-Eject Horizontal Baler

*Switch
recyclables
without
contamination
and maximize
the value of your
product*

*Minimize spillage
between bales
and reduce the
need to "double
handle" materials*

*Remove finished
bales quickly and
automatically
to improve
efficiency*

*Front bale tie off
saves valuable
floor space and
eliminates trips
behind the baler*

Solutions Group**

A DOVER COMPANY

Marathon's patented line of Side-Eject Horizontal Balers are uniquely engineered to maximize productivity. They include many features not found on conventional closed-end balers.

Side-Eject Horizontal Baler

- Increased product value by eliminating contamination between bales as the operator changes materials being processed.
- Maximum bale weights with Marathon's Bale Made Indicator, which signals the bale is finished. No time consuming "flag pole" or manual measuring device to compromise bale quality.
- Marathon's exclusive front bale tie-off system allows the operator to quickly direct tie wires around the bale from the front of the baler. This eliminates the need to go behind the baler and loosen hanging wires that drag as a bale is made.
- Eliminates spillage commonly found with conventional balers. No need to "double handle" materials being processed.
- Remove each bale from the bale chamber quickly and easily with Marathon's patented Side-Eject feature and Bale Server Island. Unlike conventional balers that require an operator and forklift to free the bale from the end of the bale chamber, Marathon's Side-Eject design provides consistent and complete bale ejection every time

The chute feed hopper with inspection door and interlock switch will accommodate pneumatic, gravity, or conveyor feeding systems.

Marathon's advanced power pack is designed so that all the valves are contained in a single manifold, which minimizes the number of hose connections.

Spring loaded container dogs are located on each side of the bale chamber to produce superior spring back control of materials being processed.

Bolt-on adjustable and replaceable shear blades cut material as a bale is made and minimize problems associated with irregular bales sizes. This makes bales easier to tie and stack.

Marathon's Side-Eject Balers feature a hydraulic door latch standard on all models.

The programmable controller allows for customized programs to better meet customer needs. The controller eliminates the need for relays and timers that take up valuable panel space. All electrical components are UL and CUL listed.

Marathon's Patented Automatic Side Ejection Features Seamless Push Button Operation

Pressure is relieved from the bale in three directions to achieve positive and complete bale ejection from the chamber.

This advanced method of bale ejection begins by activating the "Home" button, which causes the platen to retract to a pre-set location relieving the end force on the bale. The operator then opens the chamber door, which relieves side force and automatically unlocks the hinged upper section of the chamber to relieve vertical force on the bale.

With pressure on the bale effectively relieved from all directions, a hydraulic powered Server Island, located on the floor of the bale chamber, quickly and completely pushes the bale out of the chamber. The Server Island functions as a pallet, eliminating costly construction of permanent guide islands. After the bale is removed with a forklift or pallet jack, the Server Island is retracted—saving valuable space.

Space-saving design

Install Marathon's Side-Eject Baler against a wall or in a tight space. Minimal floor space is needed for operation due to the unique front baler tie-off feature and side-eject design.
